PROJECT DISCLOSURE
WANG-LIU, LLC PROPERTY
ROBIN HILL ROAD
SCARSDALE, NEW YORK

The work proposed for the site will include placing all erosion control measures prior to the start of any work. The placing of the erosion control will serve to be the limits of disturbance which will also protect the steep slopes from unnecessary disturbance. All slopes will be topsoiled and seeded, unless exposed rock, to protect the slopes from erosion. Once the erosion control placement has been approved by the Town, excavation will begin. The location of the future driveway will be used to be used as access to the site to reduce the amount of disturbance.

The new foundation will be excavated and constructed. The new house will be delivered and set on it's foundation. After the new house has been placed on the foundation and has been made weather tight, the proposed driveway will be graded and all other grading will be done as shown on the plan. When grading is near complete the proposed drainage under the new driveway will be installed.

When all construction and grading is complete, all disturbed areas will be topsoiled and seeded. When the grass has taken hold and the disturbed areas have stabilized, all remaining erosion control measures will be removed and the site completely cleaned up.
